INTRODUCTION

As the title hints, MatchBox products are ultra-compact, single-unit laser sources with overall dimensions comparable to a regular matchbox (30x50x18 mm³), connector pins not included.

The ‘MatchBox®’ series includes a range of continuous wave laser sources, featuring wide range of wavelength, output power, output type and line-width options.

The series is composed of solid state (DPSS) lasers, passive Q-Switch short-pulse lasers, multi-wavelength lasers based on classical dichroic combining, as well as direct laser diode (LD) lasers. Despite the different technical implementation, physical and electrical properties, usability and connectivity are almost identical throughout the series, representing our commitment to perfect user experience and faster time to market for our customers.

Please take your time to read this instruction manual which provides essential information about the usage of the CW single-wavelength lasers. We have also included various hints and tips that will help you to get the most out of a certain laser source.

1. SAFETY INFORMATION

1.1: Labels

Along the text you will find icons designed to draw your attention to different bits of safety or otherwise important information:

⚠️ This icon is used to draw your attention to important information, related to the usage of a laser.

⚠️ This symbol is a warning sign. It marks safety precautions related to optical laser radiation and alerts the operator to the danger of exposure to hazardous visible or invisible laser radiation.

⚠️ This symbol is a warning sign. It marks safety precautions related to electrical safety and alerts the operator about the presence of dangerous voltage, which might appear on certain conditions. Electric shocks caused by such voltage may constitute risks to the operator and the equipment used.

Figure 1-1. Labels on a side of the laser indicates product safety information. MatchBox lasers belong to the class 3B or class 4.
1.2: **Electrical safety**

Do not disassemble the enclosure. All units are designed to be operated as assembled. Warranty will be voided if the enclosure is opened by the customer.

Electric shocks from an unsuitable or poorly grounded power supply, can cause extreme pain, severe burns, cardiac arrest and in some cases can be even lethal, that is why the operator should always obey the safety measures given below.

The laser body of MatchBox is connected to the ground, this means that all internal electronics share the same ground of the laser body.

User must make sure that the power supply used with MatchBox laser has grounded pin connection, is well grounded and that there are no
grounding interruptions with other devices. Otherwise it can be dangerous for the operator and it can cause malfunction of the laser.

1.3: Optical Safety

Light, emitted from a laser source, features hazardous properties, as compared to conventional light sources, such as: luminescent bulbs, light emitting diodes and etc. It is important for users or other persons approaching to laser systems, to know the dangers involved. Only users, who are familiar with laser safety should use laser systems, this way the risks of laser radiation-related accidents would be minimized.

MatchBox lasers are Class 3B laser products with rare exceptions of Class 4. Different models are arranged to emit up to 500 mW of visible or invisible (infrared) radiation. Several models emit continuous wave (further shortened to CW) or pulsed laser radiation up to 1W of optical power.

The radiation is hazardous if the eye is exposed directly to the beam or to it’s specular reflection. The risk of permanent eye damage or even blindness increases due to longer exposure time.

Diffuse reflections as those from paper or other matte surfaces are typically not harmful if observed at a distance of 1 m (3 ft) or larger.

The use of eye protection when operating a MatchBox laser is necessary if at any circumstances the laser beam could be exposed to an eye directly or through a specular reflection.

Eye protection in the form of spectacles or goggles is preferred to be with appropriate wavelength filtering. For example, spectacles absorbing waves of spectral region from 180 to 532 nm are suitable to work with e.g. 405 nm, 457 nm, 473 nm, 488 nm, 491 nm, 515 nm and 532 nm.
MatchBox lasers, however you shouldn’t use these spectacles to filter 561 nm, 593 nm waves or radiation in the red and infrared regions.

Protective eyewear provides another significant advantage - when working in dark rooms, laser radiation could haze your eyes even if it is observed from diffuse reflections. Properly chosen eyewear definitely reduce or even eliminate such haze and extend productive hours.

The beam emitted from Class 3B lasers can easily damage photosensitive surfaces like those found in photodiodes, CCD cameras or photomultipliers. It is important to make sure that an unattenuated beam does not strike any of aforementioned devices directly. Calculation of allowed fluency is necessary before using such devices with our lasers.

In addition to laser safety from the laser source alone, given safety precautions must be followed:

• Experimental setup must ALWAYS be horizontal and below eye level;

• To avoid accidental exposure, never bend over or look down. If something falls off of experimental setup, user must first turn off the laser or close the mechanical shutter and only then pick up the fallen parts;

• Use protective shields or filters to get rid of unnecessary reflections and scattering;

• User must never wear any kind of jewellery or watches while using the laser system to avoid any laser beam reflections from those surfaces;

• The laser system must be used in a closed room, because high power and collimated laser beam can damage biological tissues even at long distances;

• Extreme precautions must be taken while using volatile substances in laser operational area;
• High level of ambient light in laser operating room should be main-
tained whenever it is possible, in order to keep the pupil of the eye as
small as possible and to prevent the risk of eye damage;
• Warning signs must be posted near the entrance to the laser opera-
tion area and inside of it;
• Use of laser must be limited to users, who are completely familiar
with the rules above.

1.4: Laser Safety and Classification

The European requirements for Electromagnetic Compatibility (EMC) are

Conformance (EMC) is achieved through compliance with the
harmonized standards EN55011:2009 for emission and EN61000-6-
1:2007 for immunity.

The laser meets the emission requirements for Class 3B or Class 4 as

Compliance of lasers within the MatchBox series with the (EMC)
requirements is certified by the CE mark.

MatchBox lasers are OEM dedicated lasers and usually come without
necessary safety means. OEM type products are designed for installation
into Class 1 enclosures. However, by adding accessories like beam
shutter and key-switch, CDRH compliance is reached.

The CDRH Accession Number for the MatchBox series lasers and
wavelength combiners is: 1810832-000.

The MatchBox CW laser alone has a simplified physical interface with just
5 pins. These pins have power supply, communication bus (UART) and
modulation/fan (predefined for different laser types) inputs/outputs. This interface is sufficient and convenient for OEM laser integration.

However, for quick laser installation into scientific setups an additional box is needed to provide necessary interlock, USB control, modulation or fan connector, complying the CDRH requirements.
2. DESCRIPTION AND SPECIFICATIONS

2.1: Part Numbers

The part number is composed as follows for the MatchBox series continuous wave lasers:

![Part Number Diagram]

Figure 2-1. Understanding part numbers of the MatchBox series CW lasers.

2.2: Description of Series

MatchBox Pulsed laser system incorporates the finest laser technology with high quality direct and DPSS diode manufacturing techniques.

The MatchBox laser system contains laser source with integrated power electronics, external PD (Power Delivery - in the latest generation of Break-out-Boxes) power supply and interface cables. The system can be
mounted to a heatsink accessory and a ‘Breakout Box’ can be used for converting UART communication to either USB or RS232. The MatchBox laser system provides power, consistency and great performance in one of the smallest packages at one of the most attractive price levels available in the market.

### 2.3: Thermal Management

The MatchBox series includes DPSS (Diode pump solid state) and direct diode lasers, whereas the higher power DPSS lasers as well as multi-wavelength diode lasers tend to generate more excessive heat than the single-wave diode lasers.

Depending on model, one or two thermo-electric coolers (TEC) are equipped inside the enclosure for thermal management of a pump laser diode and associated optics. Thermal stabilization of all critical components is very important for low-noise and efficient operation of the complete laser.

Depending on laser configuration, cooling of 5 to 25 W (5 W for most diode lasers and 10 to 25 W for DPSS) may be required in a form of conduction-cooled (AM-H8/AM-H3) or water-cooled (AM-H4) heatsink, attachable to the bottom side of the laser.

Also, depending on a laser model, a suitable heatsink must have low thermal resistance. For DPSS lasers, thermal resistance of $<0.5 \, ^\circ\text{C/W}$ is recommended, while for diode lasers $<1 \, ^\circ\text{C/W}$ is sufficient. $<0.5 \, ^\circ\text{C/W}$ requirement is usually met by a larger passive copper heat sink or an actively cooled aluminium heat sink.

In case of specific applications, such as holography, interferometry and quantum cryptography, where narrow-linewidth lasers are being used in varying environment temperature, the internal TEC of the laser might not provide sufficient thermal stability to maintain high level of coherence and
central wavelength stability. For these applications Integrated Optics, UAB released a number of TEC based coolers and adapters (AM-H9, AM-H10, AM-H11), which provide the extra stability needed. Furthermore, these heat-sinks provide higher thermal handling capacity and/or extend operational temperature range for high power DPSS lasers.

As an accessory, Integrated Optics, UAB offer a few heatsinking solutions, including self-sufficient forced air cooler, water-cooled adapter plate and breadboard adapter plate. Both adapter plates are used to fasten the laser to a standard 25 mm M6 thread pattern of a standard optical table or breadboard. Additionally, Integrated Optics, UAB offers adapter plates, which help to accommodate the MatchBox laser in place of previously installed laser of other brands. However, adapter plates need to be attached to heat sinks made of aluminium or copper, having sufficiently low thermal resistance.

For efficient cooling, make sure that there are no other heat radiating devices, such as heat exchangers, heaters or computers in the proximity of the laser.

Attaching a DPSS laser to a stainless steel breadboard through M6 optical breadboard adapter will not provide sufficient heat dissipation and the laser will most likely overheat. Steel is a very poor heat conductor.

For efficient cooling, make sure that the laser is not covered with or obstructed by any obstacles, which could prevent air circulation around the laser.

All MatchBox lasers are equipped with internal thermal protection feature. If the internal temperature reaches 45 °C, the laser shuts down or starts to blink. If this happens, turn off the laser and ensure better heat dissipation by decreasing the heat-sink temperature and increasing the heat-dissipation capabilities thereof.
2.4: Power Supply

The MatchBox series includes a variety of lasers featuring different power ratings, thus requiring different power supply parameters. Power supply requirements are provided below.

Table 2-1. Power supply requirements regarding laser type.

<table>
<thead>
<tr>
<th>Type</th>
<th>Part No.</th>
<th>MAX Current at 45 °C</th>
<th>Typical Current at 25 °C</th>
</tr>
</thead>
<tbody>
<tr>
<td>DPSS</td>
<td>XXXXL-XXB</td>

<td>0.6A</td>
<td>0.2-0.4 A</td>
</tr>
<tr>
<td>HP Diode</td>
<td>XXXXL-3XA and XXXXL-4XA</td>
<td>1 A</td>
<td>0.4-0.5 A</td>
</tr>
</tbody>
</table>

Voltage of 5 V is needed to be supplied for these types of MatchBox series lasers pins.

Lasers of the same model could require different current. For instance low-power laser 405L-21A needs maximum current of 0.6 Amps and
typical of 0.3 Amps, whereas it is estimated that low-power laser 785L-21A needs maximum current of 0.3 Amps and typical of 0.2 Amps.

For direct diode lasers the optimal power supply that we offer is the 15W PD type USB power supply (AM-P7), while for DPSS lasers we recommend to use 25 W, but optimally 45W to 60W PD-type (depending on other accessories used) power supply (AM-P8). For powering lasers through Break-out-Boxes (BoB), a PD (Power Delivery) power supply is needed. The BoB triggers the power supply to run at 9V and converts it to 5V internally.

To understand, the specifics of power supply requirements for your MatchBox laser, better, power supply requirements regarding laser type during start-up are depicted below.

**Table 2-2. Power supply requirements regarding laser type during start-up.**

<table>
<thead>
<tr>

2.5: Cables

As seen in the section “Power Supply” on page 14, different types of lasers require different power supplies, hence in some cases different cabling for MatchBox laser system is also required.

The MatchBox laser features an OEM design, where integrators implement their own physical interface to connect directly to the pins of the laser. This is the reason why it is sold without any cables in its standard configuration. However, standard cables are handy for end-user setups, and therefore MatchBox accessories come with compatible cables - power supplies are shipped with USB-C to USB-C type cables for power delivery and Break-out-Boxes are shipped with USB-A to USB-micro cable for computer communication.
Free space lasers are pre-set to start instantaneously when power is applied.

Fiber coupled lasers must be turned on via MatchBox laser control software.

Please contact Integrated Optics, UAB for a customized physical interface for data and power.

2.6: Power and Signal Connections

The MatchBox laser alone has a simplified physical interface with just 5 pins with 2.54 mm spacing (Figure 2-2). These pins have power supply, communication bus (UART) and modulation/fan (predefined for different laser types) inputs/outputs. This interface is sufficient and convenient for OEM laser integration.

Figure 2-2. Connecting pins with 2.54 mm spacing on the back side of the laser; pinout left to right.
Viewing left-to-right, the pins are dedicated for: first pin is for +VCC, next two are UART bus interface pins Tx and Rx, then follows a multifunctional pin (TTL modulation or fan speed control).

An empty slot is used as a key, ensuring that the female pinhead connector will not be inserted in a wrong orientation or position.

The fifth pin works as a ground. The ground pin is soldered into the enclosure of the laser, thus complete laser body is grounded.

2.7: Specifications

The MatchBox series includes a variety of lasers featuring different wavelength and power ratings. The actual specifications of a laser are provided in a test report accompanying a laser, which is sold to the customer.

General specifications for all laser models can be found at [www.integratedoptics.com](http://www.integratedoptics.com), you can scan the QR code below for a quick access to our website:
2.8: Mechanical Design

The laser sources within the MatchBox series employ a single-box design, which means that all optics, power electronics and thermal management components are located within a single enclosure.

The overall dimensions of the laser are 30 x 50 x 18 mm³ (Width x Depth x Height), not taking into account the connecting pins, which are used for connecting the laser to a power source and control interface. The pins extend approx. 10 mm from the back of the laser. Different output options, such as free-space output with or without a mechanical shutter, permanently fixed fibers, have different arrangements on the front facet of the laser.
Figure 2-3. Top and side view drawing of the MatchBox laser, free-space output option.
Figure 2-4. Top and side view drawing of the MatchBox laser, fiber coupled output option.
2.9: Laser Output Options

MatchBox laser sources are offered in two main configurations regarding to the type of the output.

**Free-space output** is commonly used in compact (portable) laser setups, where working area (an object to be irradiated) is relatively close to the laser source and the beam could be delivered directly or using just a few mirrors.

Furthermore, the free-space output versions are provided with a PTFE safety cap (not shown in pictures), which might be necessary for a scientific open-frame setup. The cap must be attached to the output window, whenever the laser is not in operation or it could be shut for a short period of time, in case minor adjustments need to be made without stopping the laser, thus stable operation is not lost. The cap helps to keep the output window clean during maintenance of the setup.

In all other cases, it is advisable to trigger the interlock function found on all attachable control interfaces of the MatchBox laser.

![Free-space output version of the MatchBox laser.](image)

Figure 2-5. Free-space output version of the MatchBox laser.
Permanent fiber pigtailed output has few modifications, though it looks essentially similar. The difference is in the fiber type, which is represented by the indicating colour. Multi-mode (orange), single-mode (yellow) or single-mode polarization maintaining (blue) fiber could be arranged with this output type.

It is readily used in microscopy and diagnostic setups, where few laser sources are placed in a distance from the analytical device, e.g. a microscope, and radiation of several wavelengths is delivered to the microscope via optical fibers.

Lasers with non-detachable fibers feature lower output power, 2-3 times worse output power stability, but significantly improved beam shape and homogeneity, as compared to free-space versions.

As standard, fiber pigtailed lasers do not have auto-start enabled. If one enables the auto-start function, please make sure the plastic cap is removed from fiber tip before operating the laser. If the cap is not removed, the plastic might melt and damage the fiber tip. This would not be a warranty case.

Figure 2-6. Fiber pigtailed output version of the MatchBox laser. Blue fiber jacket represents a polarization maintaining fiber type.
Lastly, Integrated Optics, UAB offers MatchBox laser sources with a SMA port.

Such lasers are supplied with a metal safety cap, as shown in Figure 2-7. The cap must be attached to the SMA port, whenever the laser is not in operation or it could be shut for a short period of time, in case minor adjustments need to be made without stopping the laser, thus stable operation is not lost.

This output option is designed for custom multi-mode fiber installations. Fiber can be supplied optionally upon clients request.

Figure 2-7. SMA port output version of the MatchBox laser
2.10: Operating Environment

MatchBox lasers are designed to be operated in non-condensing environment, in temperature range between 15 and 30 °C. Whether the customer needs to operate the laser at higher temperature, such option has to be provided by Integrated Optics, UAB during assembly of the laser. The temperature range can also be extended by attaching the laser to a cold plate, which has surface temperature in the aforementioned range and good thermal conductivity parameters.

Dusty environment might cause collection of debris on an output window of the laser. Therefore special maintenance, such as cleaning of the exterior of the output window or the fiber tip must be performed from time to time in order to keep the laser power within the desired power range and extend the lifetime of the laser.
3. INSTALLATION

3.1: Preliminary Checks

Every MatchBox unit is packed in an antistatic foam package, which is arranged to protect electronics inside the laser from charge accumulation and is absorbing mechanical shocks well during transportation. Further the foam is packed into a carton box.

![The package of a MatchBox continuous wave laser.](image)

**Figure 3-1.** The package of a MatchBox continuous wave laser.

Make sure that shipping boxes do not have any signs of damage. In case of inspected damage, do not accept the package. Such case scenario should be immediately reported to the shipping carrier, to Integrated Optics, UAB administration or to an authorized MatchBox distributor.

During unpacking, keep the box in a horizontal position. In order to see the laser, carefully remove the upper part of the foam inlay, which contains accessories and cables.
After unpacking, save the laser package boxes for potential later shipments.

Table 3-1. Contents of a typical package.

<table>

</tr>
</tbody>
</table>

Note: if there is an extra screw, which comes in slightly different shape and colour. It is used for mounting the breakout box to the heatsink or adapter.

Power supplies and bigger accessories, such as heat-sinks, ‘Breakout Box’, ‘Break out Box RS232’, key-switch, accessory bundles or external control interfaces may be packed separately.
3.2: Heatsink Requirements

To ensure satisfying operation and for the warranty to be valid, the MatchBox laser must be attached to a heat sink providing a required thermal resistance. Various types of MatchBox lasers have different thermal resistance requirements, depicted in Table 2.

Integrated Optics, UAB recommends to use a thermal paste between the MatchBox laser and the heatsink to provide proper thermal contact.

⚠️ The mounting surface of the heat sink should be flat within <0.05 mm over the mounting surface.

See Chapter “ACCESSORIES” on page 59 for more details about types of heatsinks offered by Integrated Optics, UAB.

For assistance in thermal management and system integration, please contact Integrated Optics, UAB technical support.

### Table 3-2. Heatsink requirements regarding laser type.

<td>XXXXL-1XA and XXXXL-2XA</td>
<td>15-30 °C</td>
<td>1 °C/W</td>
</tr>
</tbody>
</table>
3.3: Heatsink Installation

The CW MatchBox configurations include DPSS and direct diode lasers, whereas the higher power DPSS lasers tend to generate more excessive heat than the diode lasers.

Furthermore, all MatchBox lasers are equipped with an internal TEC (Peltier) thermal management, which, when operated, generates even more heat to stabilize optical cavity and electronics inside the laser, thus it is required to attach the laser enclosure to an external heat-sink, such as an aluminium breadboard or a water cooled plate. Optimal enclosure’s temperature is 26-28 °C for most effective operation.

In case laser installation does not meet heatsinking requirements, internal thermal protection stops the laser operation whenever the internal (laser diode) temperature reaches around 40-45°C.

As an accessory, Integrated Optics, UAB offers few heatsinking solutions, including self-sufficient forced air cooler, water-cooled adapter plate and breadboard adapter plate. Both adapter plates are used to fasten the

<table>

<td>15-30 °C</td>
<td>0.5 °C/W</td>
</tr>
</tbody>
</table>
laser to a standard 25 mm M6 thread pattern of a standard optical table or breadboard. Please contact us for purchase.

In order to operate the heatsink appropriately, please follow these steps:

1. Secure the heatsink with M6 bolts to a desired location. Ensure that proper air flow is granted.

2. Apply thin layer of thermal paste to the interface between the laser and the heatsink. Spread the paste evenly and remove the surplus.

3. Mount the MatchBox laser head to the heatsink with the M2.5 screws.

4. Connect laser with a required power supply. See section “Starting the laser” on page 31.

5. If needed, proceed to section “Starting the laser” on page 31.

For the best performance, screws for fixing the laser to a mounting plate should be screwed with tightening torque of 0.25 - 0.35 N·m.

3.4: Starting the laser

No user adjustments are possible inside the laser. Never open the laser module. Any attempt to open the laser module will damage it and render the warranty void.

Maintenance of the product is done exclusively by Integrated Optics, UAB personnel at the factory.

1. Make sure that the MatchBox laser head and the heatsink are secured in place according to the instructions in section 3.3: Heatsink Installation.
2. Download the MatchBox control software at the “Downloads” section on our website.

3. When the download is finished, you need to extract .zip file to desired directory.

![Device Driver Installation Wizard]

Figure 3-2. Initial installation window.

4. After the installation procedure is finished, you need to install the CP210xUSB to UART Bridge Driver. To do that you need to run either CP210xVCPInstaller_x64 or CP210xVCPInstaller_x86.

5. While installing the driver you will be asked to read and accept the license agreement to proceed.
6. After accepting the agreement, the driver will automatically install and you will be informed about the successful installation.
7. When drivers are installed successfully, you can run the MatchBox-Controller file. It is a portable application and it does not need to be installed.

See section “Laser Control Software” on page 38 to learn about the use of the control software.

For assistance in thermal management and system integration, please contact Integrated Optics, UAB technical support.
4. OPERATION

4.1: Operating Fiber Coupled Laser

Fiber coupled diode laser / DPSS laser is a compact and robust unit for alignment-free operation throughout the lifetime of the laser.

Proprietary fiber coupling technology ensures good power stability and excellent fiber-coupling efficiency.

FC/PC connector is provided as a standard for all non-SLM lasers, the same configurations of SLM fiber-coupled lasers come with FC/APC, in order to minimize impact from back-reflections. In any case, the pigtail length is approximately 1 m. Other connectors and fiber lengths are available on request.

Figure 4-1. Exemplary Fiber Coupled Laser. SLM Laser; MM Fiber.
The fiber cap has to be removed before turning the laser on. Starting the laser with a safety-cap attached might damage the laser and render the warranty void.

Fiber coupled lasers must be turned on via MatchBox laser control software. The autostart function shall be only enabled after careful consideration of laser safety and potential contamination of the fiber tip.

**4.2: Operating Free-space Output Laser**

Free-space output MatchBox lasers series deliver superior performance regarding power stability, signal to noise ratio, beam properties, polarization contrast and many more. Plug and play operation allows the customer to use the laser as soon as possible, saving hours of precious time.

Scientific open-frame setups might require full CDRH compliance. The PTFE cap (provided with each free-space laser) can be used as a shutter, i.e. attached to the output window or a mechanical shutter assembly can be purchased from Integrated Optics, UAB. Using these options a laser is not in operation or it could be shut for a short period of time, in case minor adjustments need to be made without stopping the laser, thus stable operation is not lost.

In all other cases, it is advisable to trigger the interlock function found on all attachable control interfaces of the MatchBox laser.

Full CDRH compliance is reached only with additional accessories. Please contact your sales person for a proposal.

Free-space lasers start instantaneously when power is applied, i.e the auto-start function is enabled by default at the factory.
Fiber coupled lasers must be turned on via MatchBox laser control software.

4.3: UART bus

UART (Universal Asynchronous Receiver/Transmitter) is a commonly used communication device in computer based systems. UART communication can be converted to USB and RS232 by using USB control interface AM-C8 or RS232 control interface for MatchBox (AM-C3).
4.4: Laser Control Software

The control software incorporates many useful parameter settings and readings. It also displays operational hours and times the laser has been started.

The software window is shown in Figure 4-3. The window is divided in four segments. Each segment represents different control field of the MatchBox laser. Right above the first segment you can see a port number, an item name, a serial number and a hardware version. The first segment is used for turning on the power of the laser, but laser isn’t emitting light. A warning sign can be seen in this segment too. It indicates weather the laser power is on or off. Next parameter seen in this column is operating mode of the laser. There are three types of operating modes:

if laser beam is turned off, the laser is in warming mode - Wrm;

if laser is in ACC mode, it means that laser is in automatic current control;

if laser is in APC mode, it means that laser is operating in automatic power control mode.

The second section of the software window is used for laser power control. You can enable or disable laser radiation, change the units of optical power setting. This column also shows the current of the laser diode - its maximum value and the actual current. In the status bar if the circle is green, the laser is emitting light, if it is grey, laser radiation is turned off.

The third section is for controlling operation modes of the laser - ACC/APC, auto-Warm-up, auto-start.

The last section is for observing temperature of the laser body and the laser diode, cooler status, fan load and laser input voltage.
Any warning signs seen in the main window display explanations if clicked on them.

![The main software window for CW lasers.](image)

**Figure 4-3.** The main software window for CW lasers.

There are two versions of the software – User edition (limited functionality) and Integrator edition (less limited functionality). In user edition grey-like parameter settings are unavailable to the user.
Figure 4-4. Laser control software window when a CW laser is connected and radiating.

After launching the software, connect the laser to the computer. The connected device should appear automatically as shown in Figure 4-5.
Figure 4-5. Laser connection window
If laser is connected to the computer, but no devices are shown, please check if USB ports are connected correctly. After checking the connection press refresh button, until the device is shown.

Laser control software will not work if a laser is not connected to a power supply. In the first instance, the laser should be connected to PC via USB type B cable. Only then the laser should be connected to the power supply using a breakout cable or a breakout PCB.

Whether some parameters are changed, they are not saved automatically. This is done intentionally for several reasons. Whether the new laser parameters make the laser operate undesirably, the user can always simply disconnect the laser from USB and power supply and
connect it again - the old settings will be restored and displayed on the screen.

Another reason not to write new parameters in the memory is limited write cycles of the EPROM. Especially if integrators are making their own control software, having for example a slider for power setting, one stroke of such slider might result in hundreds of values saved in the EPROM, reducing its cycle capacity.

In order to save newly set parameters in the laser memory, user must press “Save settings” at the bottom of the main software window.

![MatchBox Controller v1.11.0](image)

**Figure 4-7.** In order to save newly set parameters in the laser memory, user must press ‘Save settings’.
Next, we will briefly describe particular lines of the software window. These lines are accessed through “More” section in the right top corner of the main software window.

![Figure 4-8. ‘More...’ section view](image)

‘More...’ section provides detailed information about a laser: item code, serial number, firmware version, operational time (laser working time), started time (how many times turned on), and virtual port. Also this section provides other laser control options.

‘Access level’ function is used as a protection that allows different type of users to operate the laser safely without a risk to misconfigure it.
Figure 4-9. ‘Access level’ section view.

Access level can be changed to Level 1 with a command ‘c u 1 1234’.

If access level is not sufficient to execute a command, the laser will return <ERR 1>.

For access level 2 and level 3 code please contact your distributor.

‘Send command’ section is used for sending commands directly to the laser.
Entering commands with higher access levels might cause laser to disfunction.

Figure 4-10. ‘Send Command’ section view

“Programmable pin” section is used for number 4 pin (TTL). To program this pin access level 2 or 3 is needed.
‘Fan temperature control’ section is used for controlling fan rotation speed. Fan speed can be set to maintain the laser body temperature in the range from 15 deg.C to max 35 degrees. Controlling fan speed helps to stabilize laser body temperature and prevents it from heating up.

If the temperature in the environment is too hot, e.g. 30 deg. Celsius or higher, or the surface area of the heatsink is too small to radiate enough heat, the fan speed control might not be enough and at some point the temperature of the laser body will keep rising until the laser shuts down at the pre-programmed temperature level.
Figure 4-12. ‘Fan Temperature’ section view

‘Generate report’ section provides user the ability to generate a report about the laser. This report provides information of what settings were set, what is the type of laser (model name, serial number) and other parameters.
Laser will start emitting light as soon as the ‘Enable’ button is pressed. Please make sure that there is no risk of getting the laser to radiate to an eye or skin of a person, as outlined in the chapter “SAFETY INFORMATION” on page 5.

Before starting the laser, make sure that the cap is taken off of the output window or a fiber connector.

After connecting the laser to a PC via USB port, all information that is saved inside the laser will be read and displayed in the computer screen. Information about laser firmware version, serial number, model, operating
duration and times the laser was started will be provided on the right side of the application window in the section ‘more...’.

More than one laser can be connected to a computer simultaneously. All connected lasers can be controlled with multiple program windows – one for each laser, but these lasers must be connected to different COM ports. Once connected, lasers are detected automatically. If a newly connected laser is not found, try to check if laser USB port is connected properly and press the ‘Refresh’ button.

The lasers in MatchBox series can have either one or two TEC (thermo-electric cooler) elements arranged inside the laser body. One TEC is used for thermal control of a laser diode and another TEC can be used either for VBG (in direct diode lasers) or non-linear crystal (in DPSS lasers with second harmonic generation). Both temperature values will be displayed in the program window. The user can also observe a percentage of TEC capacity, which is being used. If TEC value is near 100% for more than 10 seconds, it means that the laser does not get enough heat dissipation and it heats too much. In such case, the laser will turn off automatically if internal laser diode and laser body temperature reaches 40 deg. Celsius.

Default laser parameters will be displayed, once the laser is connected to the computer and power is supplied. In order to save customized parameters, click ‘Save Settings’ at the bottom of the main window.
4.5: Changing Output Power

In order to change the optical power of a laser, DAC (digital-analogue converter) value should be entered. The DAC value is related to the internal optical feedback loop and represents a value of optical signal, which must be detected by the internal photodiode and the values are from 0 to 8191, however each laser has a pre-set power limit and in most cases maximum optical power value will be lower than 8191 DAC value. Other options of changing the laser power are setting the power of the laser in mW (in APC operation mode) or in mA (in ACC operation mode).

If the laser power is calibrated, calibration values are saved in the internal micro-controller. In such case, the optical power can be entered in mW. Calibration process can be either done in the factory or user can request instructions from the manufacturer, describing how to do the calibration in a specific setup. For calibration instructions, please contact our tech support team writing an email to support@integratedoptics.com.

Calibration is also possible for fiber coupled lasers, as well as for a complete turnkey system, e.g. a microscope setup.

4.6: Communication Command Table

The following commands are used with MatchBox series lasers at serial communication rate of 115200 bps.
Table 4-1. Communication commands of MATCHBOX lasers.

</tbody>
</table>
a. To execute the commands, access level must be equal to the values given in the table or higher.
b. To change access level, command argument code can be provided by sales person on separate request.

The list below explains error codes for MatchBox lasers:

- 0 - error name not assigned yet
- 1 - command forbidden for current access level
- 2 - laser already on or making ramp-up
- 3 - laser busy, task is not complete please wait for 1 s and try again
- 4 - arguments out of range
- 5 - unknown command
- 6 - laser must be enabled to execute this command

4.7: Communication with Multiple Lasers in a Bus

There are several ways, how integrators can connect and control multiple lasers in a single communication bus. Our engineers have tested and recommend connecting diagram as depicted in Figure 4-14.
This communication diagram is based on simultaneous communication from the system UART controller to all connected lasers and individual response from a particular laser. Random response timing is used only for laser initialization with ‘ID?’ command.

One example of such communication is shown in Figure 4-15, where the system UART enquires all lasers in the bus to send their IDs. All lasers respond randomly.

All communication from the laser side features commands with ‘<’ ‘>’ beginning and end symbols.

A new laser can be connected while others are operating. ID request is repeated in order to collect IDs once again.
Figure 4-15. ID request sent from the system UART to a bus with multiple lasers.
Controlling multiple lasers with Integrated Optics, UAB software isn’t possible. It is only an example for integrators.

4.8: Attaching Control Interfaces

The pins of the laser can be attached to control interfaces, which are designed as accessories of the MatchBox series. On the other hand, in OEM arrangements, the pins can be connected to a custom electronics within an instrument or portable laser equipment, which is arranged to work as a control interface for the laser.

Orientation of the pinhead has to be taken into account, when connecting a control interface to the laser.

All pins of the laser must connect to corresponding pins in the control interface. Wrong connection of the pinhead might lead to permanent damage of the laser electronics and the warranty will be void.

Do not solder or bend the pins of the laser. These actions might make service impossible and thus void the warranty.
5. **ACCESSORIES**

Integrated Optics, UAB offers a variety of accessories for heat management, power supplying and mounting.

As our company strives for perfection and diversity, our engineers and researchers work hard everyday to make slight improvements of our products, especial in new products newly created equipment. Henceforth, accessories in MatchBox user manual are described in general, without going into specifications of each product.

For additional detailed information please visit our website at www.integratedoptics.com.

5.1: **Compatible accessories table**

All accessories and laser versions that are compatible with them are given in the link and QR code below.
6. TROUBLESHOOTING Q&A

Whether there are any technical issues concerning our products or any general questions, we are always willing to answer it as fast as possible via email or phone. In order to save both our and our clients time, we have provided a list of frequently asked questions.

6.1: Frequently Asked Questions

Q: What type of power supply should I use?
A: It should be 5 V output power and 4 A current for DPSS lasers and 1 A for diode lasers. We highly recommend to use the same power supply as we offer on our website. Otherwise we cannot ensure that the laser would work the same as it was tested during production. Note: Some lasers can draw a little more current at the moment of turn on, compared to specified.

Q: Power has dropped drastically. What happened?
A: There might be several reasons: the laser overheating, the power supply is not sufficient, the laser diode or pump diode has failed. Please check if heat dissipation is sufficient. Launch the laser control software, check whether the TEC is not operating at 100% capacity. What is the voltage between +5 Vcc and GND pins? It should be not less than 4.0 V and not exceed 5.5 V. In case the voltage is different, wires might be too long or too thin or other components are involved that might cause voltage drop/increase.

Q: How should I cool the MatchBox series laser?
A: Diode laser typically requires 5 W heat dissipation so basically such laser could be cooled when attached to any optical table or cooling device. DPSS laser typically requires 15 W heat dissipation so such laser should be cooled using our air-cooled heatsink (AM-H3) or Adapter to M6 with water cooling option (AM-H4).
Q: How to be sure that laser gets enough cooling?
A: During production, our lasers are tested on a large aluminium breadboard - this is one example how to dissipate heat. Keep in mind that steel has very poor thermal conductivity, therefore conventional optical tables and breadboards are not suitable for heatsinking of DPSS lasers. Customer should always use thermal paste when mounting the laser. Body temperature of the laser should not exceed about 35 °C, and the TEC load should not exceed 80%, with rare exceptions. Diode laser needs no more than 7.5 W heat dissipation. DPSS lasers usually require more – about 15 W heat dissipation. All diode lasers and majority of DPSS lasers in the MatchBox series could work properly attached to our forced air cooler.

Q: What accessories are needed in order to use MatchBox laser?
A: The MatchBox series is designed for OEM applications. Integrators can install the laser without any other accessories, just by providing 5 V power and UART control signals to corresponding pins on the back of the laser. However for quick setup, a breakout PCB or a breakout cable is a good help to start the laser and connect it to a PC via USB. Breakout PCB and a standard USB cable is always included in the laser package free of charge. Also power supply and AC power cable are necessary. You should have in mind that power supply should be ordered separately and that power cable is not included in the package with the power supply.

Q: What is the Breakout-Box?
A: Breakout-box includes a small printed circuit board attachable directly to the pins of the laser. This electronics board features a USB-C power socket, a pin for TTL signal, a fan control socket. Furthermore it incorporates a UART-to-USB converter chip (SiLabs) and a micro USB socket for remote control.

Q: I changed the laser power in the control software, but after restart of the system the new power setting was not saved?
A: New parameters are not saved in the micro-controller of the laser
unless ‘Save settings’ at the bottom of the main software window is activated. This is done to save EPROM write resource.

**Q: What fiber core diameter do you use?**
A: We use fibers from many different vendors. Whether you need to know the actual fiber details, please contact us in order to get detailed information, such as core diameter or NA of the fiber.

**Q: When do I have to use FC/PC and FC/APC fiber connector?**
A: We recommend to use FC/APC for SLM lasers - this is to avoid back-reflections from a polished fiber tip to the laser cavity. In all other cases both FC/PC or FC/APC connectors can be used, depending on users preference.

**Q: Should I ensure grounding for the laser?**
A: If you are using only USB-C cable (without power adapter), you might feel static electricity coming out of the laser. We recommend, that if you have GND from the 220V power socket, you should connect power socket GND to the laser body or to the laser GND pin.

**Q: Can I modulate the laser with PWM square wave?**
A: In general, yes. However, the bandwidth of PWM depends on the laser type and pinout configuration. For example, by default, DPSS lasers are configured for fan control instead of TTL modulation. It can still be PWM controlled by sending commands over UART interface with up to 1kHz bandwidth. Direct diode lasers are typically configured for fast (up to 10MHz in ACC mode) modulation instead of fan control, thus PWM with a bandwidth of 10MHz is possible.

**Q: Do I get a replacement if the laser is broken?**
A: Lasers within warranty period are repaired or replaced free-of-charge. Warranty becomes obsolete in cases indicated in the chapter ‘Warranty’.
Q: I have ordered a SLM laser, but can observe more than one longitudinal mode. How can I solve this problem?
A: It is possible that laser is working at non-optimal temperature point. First step is to make sure if the laser gets enough heat dissipation. Second step is to adjust laser diode (or cavity) temperature using the laser control software. For this access level 2 is needed. Please contact Integrated Optics, UAB for further instructions.

Q: How hard should I tighten the screws of the laser?
A: Recommended Tightening torque is 0.25 - 0.35 N·m.

Q: Laser is working, but it's body is very hot.
A: First of all it means that the laser diode should be fine, but it could be that heat dissipation is not sufficient. You should check how much Amperes does the laser consume. It should be no more than 1.5 A for diode lasers and typically no more than 4 A for DPSS lasers (exceptions may apply).

Q: Laser emits no light at all. Power is 0mW.
A: Firstly, internal coldplate of the laser could be more than 45 °C temperature. If the laser is fiber-coupled, another option is that the fiber damaged inside the jacket. You should check for any damages on the fiber itself or its connector. Recommendations: Before turning the laser on, proper cooling of the laser should be ensured. Laser should be mounted using thermal paste and the screws that were provided with the laser. Please make sure that thermal paste is put very evenly and covers whole bottom of the laser. If laser is fiber coupled, the fiber should be carefully straightened up first.

Q: Is there a recommended way to improve the Diode laser’s longevity?
A: Cold start is one of the factors reducing the lifetime of laser diodes, especially pump laser diodes in DPSS lasers. ‘Warm laser’ is the best
mode for stand-by operation to improve the longevity of the laser diode or the pump diode.

**Q: How to send laser to a warm-up state?**
A: There are two ways to send laser to warm-up state, or in general to control laser: using our software. There is simply a button, that says ‘Auto Warm-up’ or sending commands via terminal. The command is: ‘e 2’.

**Q: What command must be sent to read MatchBox 2 CW laser input voltage?**
A: To read the input voltage “r_r” command must be used. The information it returns is explained in command table in User’s manual.

**Q: Is AM-H8 cooler suitable with DPSS lasers?**
A: Unfortunately DPSS lasers require a better cooling system. The most suitable coolers in this case would be AM-H9 or AM-H3.

**Q: Turned on laser voltages are below the nominal 4.8V to 5.3V mentioned in the laser specs., is there something wrong with the laser?**
A: If the laser works, the voltage isn’t below 3.5V which is the minimum voltage for the internal microprocessor to operate, doesn’t overheat and cools itself, then the voltage drop can be not taken into consideration.

**Q: Our laser has a Firmware version of 1.76483. Is there a later version of the firmware and can it be upgraded?**
A: Updating firmware is highly not recommended, because if in any case power source would disconnect or get damaged while updating, laser would be instantly damaged and would have to be sent to Integrated Optics, UAB for repair. So laser firmware can only be updated in particular situations after consulting with the support team at Integrated Optics, UAB.
Q: After a while of working, laser power dropped by a few mW, why is that?
A: There could be a few reasons why the laser power might drop by few mW:

1. The laser is getting some back-reflections and these are having impact on the internal photodiode response. The photodiode ‘sees’ more light and triggers the driving electronics to reduce LD current.

2. Environmental temperature changed significantly and the internal photodiode isn’t perfectly thermally stabilized and it’s temperature has changed as did the quantum efficiency of the laser.

3. The wavelength of the laser diode drifted. If it is on the slope of efficiency of the photodiode, then wavelength change of hundreds of picometers can change the response of the photodiode. Please, adjust the DAC value to restore the power level. If the power of the laser was calibrated, you might want to recalibrate it.

4. The power sensor of the power measurement degraded.

5. The power sensor got saturated. Please, check the parameters of the power sensor.

In cases 1 to 3 it should be visible in the software window that the LD current decreased upon decrease of the laser power.

Q: Is there a way to change the polarization direction of MatchBox lasers?
A: You can change the polarization direction by turning the laser body by a desired angle or using optical devices like: quartz polarization rotator, waveplate/2. We should note that different types of MatchBox lasers have different polarization direction, but two of the same type lasers of MatchBox’es must have the same polarization!

8. Warranty

Integrated Optics, UAB warrants the MatchBox laser to the original purchaser (the Buyer) only, that the laser system, that is the subject of this sale, (a) conforms to specifications provided before a certain laser has been shipped to the buyer and (b) is free from defects in materials and workmanship.

The MatchBox lasers are warranted to conform to Integrated Optics, UAB published specifications and to be free from defects in materials and workmanship for a period of:

- 14 months or 10000 hrs, whichever occurs first;
- Operational time calculation is based on an internal EPROM counter.

The Buyer is responsible for providing the appropriate utilities and an operating environment as outlined in the product literature. Damage to the laser system caused by failure of the buyer's utilities or failure to maintain an appropriate operating environment, is solely the responsibility of the buyer and is specifically excluded from any warranty, warranty extension, or service agreement.

The Buyer is responsible for prompt notification to Integrated Optics, UAB of any claims made under warranty. In no event will Integrated Optics, UAB be responsible for warranty claims made later than seven (7) days after the expiration of warranty.

8.1: Limitations of Warranty

The foregoing warranty shall not apply to defects resulting from:

- Components and accessories manufactured by companies, other than Integrated Optics, UAB, which have separate warranties,
• Improper or inadequate maintenance by the buyer,
• Buyer-supplied interfacing,
• Operation outside the environmental specifications of the product,
• Unauthorized modification or misuse,
• Improper site preparation and maintenance, or
• Opening the laser housing.

THIS WARRANTY IS EXCLUSIVE IN LIEU OF ALL OTHER WARRANTIES, WHETHER WRITTEN, ORAL OR IMPLIED, AND DOES NOT COVER INCIDENTAL OR CONSEQUENTIAL LOSS. Integrated Optics, UAB SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.
